What's New in the Omega Sync?

Omega Sync is a handy and reliable application designed to help users to automatically synchronize and compare the local or remote databases. Omega Sync supports tables, indexes, triggers etc. and you can even synchronize data of heterogeneous databases. You have the possibility to choose between three data synchronization modes such as Compare only where no data is changed, One-Way Synchronization where you have to specify which records or data cells you want to skip and Two-Way Synchronization where you can move changes across to any database. Also, Omega Sync support databases like Access, MySQL, SQL Server, Oracle, Interbase, Firebird and ODBC sources. Note: Before you start working with the application, you have to get an activation code. Omega Sync Features: - Compare only; which means that no data is changed - One-Way Synchronization; which means that you specify which records or data cells you want to skip. - Two-Way Synchronization; which means that you can move changes across to any database. - Ability to set the synchronization mode - Build Database; which means that you can build a database to contain your tables in the format you need them in - Import/Export Table Structure; which means that you can import/export tables structure from one to another database. - Import/Export Tables; which means that you can import/export tables from one to another database - Table Data in the new database (SQL Server); which means that you can also import or export data in the new database. - Import/Export Data; which means that you can import/export data from one to another database. - Select All data; which means that you can select all data for the specified table in the new database. - Delete Entire table; which means that you can remove all tables for the specified database from the new database. - Drag data across to a new database; which means that you can drag data between the new and the old database. - Edit/Delete data in the new database (SQL Server); which means that you can change data in the new database. - Import/Export Data in the new database (SQL Server); which means that you can import/export data from one to another database. - Import/Export Table; which means that you can import/export a table from one to another database. - Import/Export indexes; which means that you can import/export indexes from one to another database. - Import/Export Index; which means that you can import/export an index from one to another database. - Import/Export Trigger; which means that you can import/export triggers from one to another database. -
